                                                                                                                                                                                                                                                                                                                                                                                Amino acid sequences AAV38499-Y38944 represent Neisseria meningit and N. gonorrhoeae antigenic proteins. They are encoded by open treading frames (ORFs) AAZ11972-Z1358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         95;

                   AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54576 and AAZ54576 and AAZ54713 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N gonorrheae polynucleotides and polypeptides. AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseriab bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.

These include the dsbA, fhaB, fhuA, rni5, rth17, rth18, rth19, rth20, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          against Neisseria infections e.g. bacteremia and meningitis -

These include the dsbA, f feveral genes from Neisseria meningitidis. These include the dsbA, f fhuA, rni5, rth17, rth18, rth19, rth21 and tolC genes. These be used in the diagnosis and treatment of infection by the bacterium which can lead to meningitis and bacteraemia, and in vaccines to pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic polypeptides derived from Neisseria meningitidis nucleic acids that encode them, useful for diagnosing and vacagainst Neisseria infections e.g. bacteremia and meningitis -

```
The invention relates to a library of DNA fragments of Escherichia colistrain polymucleotides (ABABST7-ABAB812) and ABAB8533) and encoded proteins (ABB52459-ABB52919 and ABB52954-ABB52954) but a B2/D+A-. The polymucleotides have potential antiinflammatory,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

          compositions used to treat, palliate or prevent extra-intestinal E. coll infections. The polypeptides are useful for determining the phylogenic group of a given E. coll strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicement, appeneithitis and meningitis this is particularly advantageous as bacterial resistence is increasing with the more frequent use of broad spectrum antibiotics.
antibacterial and immunosuppressive activity as part of pharmaceutical

These include the dsbA, fhaB, fhuB, rni5, rth17, rth18, rth19, rth20, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent beers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing in the manufacture of medicaments for treating or preventing infection due to be used to Seserie de.g. meningitis and septicaemia), to detect the be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                              33;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                225

The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dsbA, fhaB, fhuA, rniS, rthl7, rth18, rth19, rth20, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polymucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polymucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dsbA, fhaB, fhuA, rniS, rth10, rth10, rth10, rth20, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunogenic polypeptides derived from Neisseria meningitidis and the nucleic acids that encode them, useful for diagnosing and vaccinating against Neisseria infections e.g. bacteremia and meningitis -

The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dabh, fhab, fhub, rni5, rth17, rth18, rth19, rth20, rth21 and to1C genes. These can be used in the diagnosis and treatment of infection by the bacterium,
                                                                                                                                                          Immunogenic polypeptides derived from Neisseria meningitidis and the nucleic acids that encode them, useful for diagnosing and vaccinating against Neisseria infections e.g. bacteremia and meningitis -

Novel polypeptides designated BASB 082, 083, 091, 092, and 101 derived from meningococcus bacterium useful for producing vaccines against infections and in diagnostic assays -

Claim 3; Page 102-104; 108pp; English.

The present sequence represents a BASB083 polypeptide. The specification describes BASB082, BASB083, BASB091, BASB092, and BASB0101 polypeptides. The polymucleotides and polypeptides are useful as diagnostic reagents and for diagnosing N. meningitidis infection. The polymucleotides may be used as hybridisation probe for RNA, CDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB082, BASB083, BASB091, BASB092 or BASB101 polypeptides and to isolate cDNA and genomic clones of other genes that have a high identity particularly high sequence identity to BASB082, BASB093, BASB091, BASB092 or BASB082, BASB093, BASB091, BASB092, BASB093, BASB091, BASB092 or BASB082, BASB083, BASB091, BASB082, BASB093, BASB091, BASB092 or BASB082, BASB083, BASB091, BASB083, BASB091, BASB093, bacteremia and meningitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dsbA, fhab, fhuA, rni5, rth17, rth18, rth19, rth20, rth21 and tol6 genes. These can be used in the diagnosis and treatment of infection by the bacterium,

These include the dsbA, fhab, fhub, rnis, rth17, rth28, rth18, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent

                                                                                                                                                                     The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dsbA, fhab, fhub, rni5, rth17, rth18, rth19, rth20, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent

The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dsbA, fhaB, fhuA, rniS, rthl7, rth19, rth19, rth20, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent
nucleic acids that encode them, useful for diagnosing and vaccinating against Neisseria infections e.g. bacteremia and meningitis -

The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the more

Ş

The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dsbA, fh. fhuh, rni5, rth17, rth18, rth19, rth20, rth21 and tolC genes. These c. be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent

prevent

can

Sequence

700 AA

infection.

                                                                                                                                                                                                                                                                                                                                                  A candidate adhesin (AAR75366) was identified that is a homologue of the IrgA protein of Vibrio cholerae. The adhesin enables Escherichia coli O157:H7, an antibiotic-resistant, virulent and common food-borne pathogen, to adhere to epithalial cells. Recombinant adhesin was obtd. by expression of the encoding sequence (see AR10105) in E. coli HB101 (pax7). The adhesin can be used as a vaccine for immunisation of cattle against disease or colonisation of mucosal surfaces by O157:H7, thus increasing the safety of food

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprising nucleotide sequence encoding one or more antigenic epitope of iroNec is useful for diagnostic and immunotherapeutic purposes. The iroNec antigenic peptide is useful for treating or preventing extraintestinal infections (EIs) caused by extraintestinal pathogenic E. coli (ExPEC). The EIs include urinary tract infection (UTI), meningitis, intra-abdominal infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         an immunogen in vaccine formulations.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dsbA, fhaB, fhuA, rni5, rth17, rth18, rth19, rth20, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent such infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunogenic polypeptides derived from Neisseria meningitidis and the nucleic acids that encode them, useful for diagnosing and vaccinating against Neisseria infections e.g. bacteremia and meningitis -

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella

The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Bo organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.
                                                                                                                                                                                                                                                                      and N. gonorrhoeae antigenic proteins. They are encoded by open reading frames (ORFs) AAZ11972-Z12358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  37;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a library of DNA fragments of Escherichia colistrains comprising polynucleotides (ABA8877-ABA88729 and ABA89533) and encoded proteains (ABB52919-ABB52914-ABB53094) of nature B2/D+A-. The polynucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, pallate or prevent extra-intestinal E. coliinfections. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advancageous as bacterial resistance is increasing with the more frequent use of broad spectrum antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                A library of DNA fragments of Escherichia coli strains for the phylogenic determination of a given strain comprises polynucleotides of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a library of DNA fragments of Escherichia coli strains comprising polynucleotides (ABA88577-ABA88729 and ABA89533) and encoded proteins (ABB52459-ABB52919 and ABB52954-ABB53094) of nature B2/D+A-. The polynucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, palliate or prevent extra-intestinal E. coli infections. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat in undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicemia, pyelonephritis and meninglitis this is particularly advantageous as bacterial resistance is increasing with the more frequent use of broad spectrum antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 6; Fig 6; 646pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   뭐
              molecules can degrade or transport fumonisin and can reduce the pathogenicity of a fungus producing fumonisin. The plants may be e.g. maize, sorghum, wheat, tomato, soybean, alfalfa, sunflower, Brassica, cotton or rice. The products can also be used as detection reagents for fumonisins and related compounds. AAS91253 represents the Bacterium 2412.1 fumonisin catabolic gene cluster, and AAS91254 to AAS91273 represent isolated nucleic acids from Bacterium 2412.1 which encode AAY80085 to AAY80104. AAZ91286 to AAS91291 represent sequence used in the exemplification of the present invention. AAZ91274 to AAZ91285 are given in the sequence listing from the present specification but are not specifically mentioned further.
                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes isolated nucleic acid molecules which encode fumonisin degradative enzymes and transporters from a Bacterium 2412.1 fumonisin catabolic gene cluster. The Bacterium 2412.1 was isolated from maize. The nucleic acid molecules can be used for producing an enzyme for detoxifying fumonisin or a structurally related mycotoxin, e.g. in harvested grain, or processed grain which is to be used as animal feed or silage. Ruminal microorganisms transformed with the nucleic acid molecules can be used as probiotic compositions or as feed inoculant compositions. Plants transformed with the nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid molecules which encode fumonisin degradative enzymes and transporters, used for detoxifying fumonisin or related mycotoxin or reducing the pathogenicity of fungi producing fumonisin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1;

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria abacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.

                                                                                                                                                                              AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                       Claim 2;

                                                                                                                                                                                                                                                  The invention relates to a method of identifying compounds that modulate a newly identified mar regulated (NIME) polypeptide activity. The method comprises contacting an NIME polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the modulators. NIME nucleic acids and polypeptides are used in the treatment of microbial infections, and in screening for modulators of NIME expression and activity. These modulators can be used to reduce the infectivity of a microbe on a surface, and the virulence of a microbe in a subject suffering from an infection. AAU29379 represent Escherichia coli NIME amino acid sequences of the invention.
                                                                                                                                                                                                                          Sequence
